New Precision Results on the Spin Structure Function g_1^d

P. Lenisa (on behalf of the HERMES Collaboration)
Universita di Ferrara and INFN sez. Ferrara, Italy

The HERMES experiment studies the spin structure of the nucleon using the 27.6 GeV longitudinally polarized positron beam of HERA and an internal target of pure gases. Recently, Hermes presented preliminary results on the deuteron spin structure function g_1^d in the kinematic range $0.0021 < x < 0.85$ and $0.1 < Q^2 < 20$ GeV^2 based on a restricted data set. Here, new, precise results will be presented using the superior statistics of the 2000 data taking period. The reduction of the systematic uncertainty which could be achieved in this preliminary analysis relies mainly on the excellent performance of the target. That data will be discussed in comparison with previous measurements performed at SLAC and CERN.
